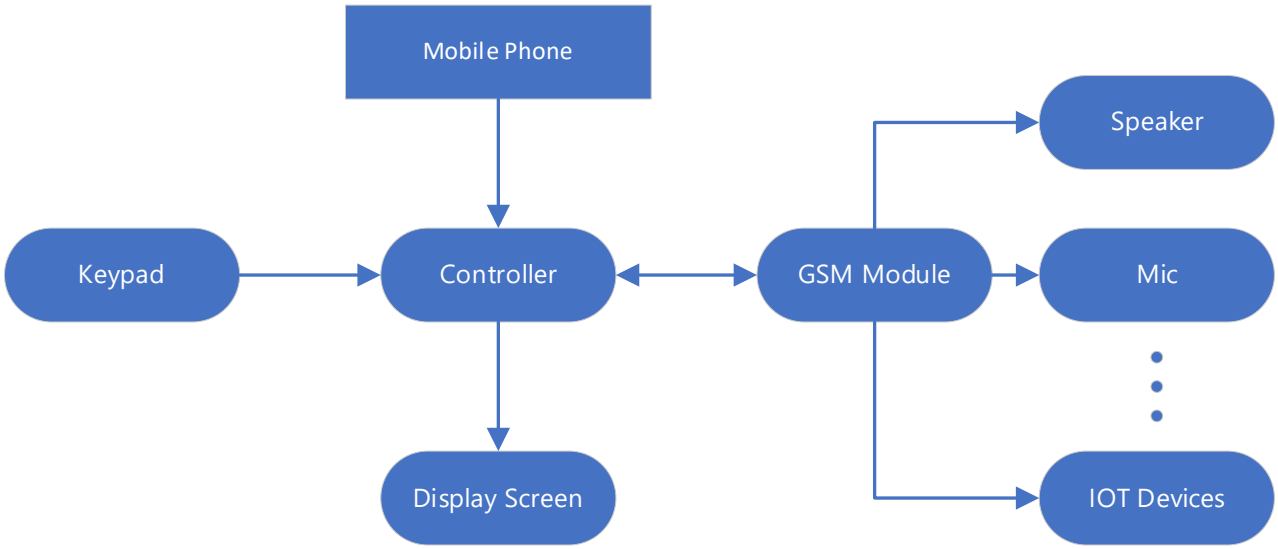
Introduction:

This project demonstrates a GSM-based communication system using a microcontroller to establish and manage calls between mobile phones. The system acts as an intelligent intermediary that controls cellular communication through AT commands and a GSM module. By integrating embedded systems with mobile networks, the project highlights how microcontrollers can automate telephony operations and enable remote wireless communication. This work reflects the growing importance of GSM technology in embedded and IoT applications.

Project Main Idea (block diagram):



Project components:

- **Controller (Arduino or ESP32 or Node MCU)**

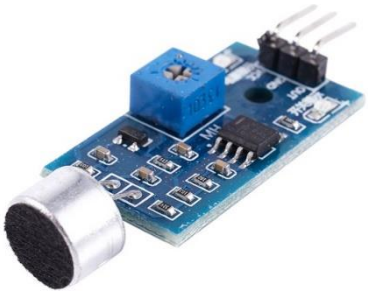
- **OLED screen**

- **Keypad 4 × 4 or larger**

- **SIM800L GSM Module**

- **Speaker**

- **Mic**



- **Relays**
